FAQ: ISPE Good Practice Guide and Cold Chain Management

Q1: What is the difference between GDP and GMP in the context of the ISPE guide?

A1: While both are crucial for pharmaceutical quality, Good Distribution Practices (GDP) focus specifically on the distribution phase of the product lifecycle, encompassing transportation, warehousing, and handling. Good Manufacturing Practices (GMP) cover the manufacturing process itself. The ISPE guide integrates elements of both, ensuring a seamless and compliant process from production to patient.

Q2: How often should cold chain monitoring systems be calibrated?

A2: The calibration frequency depends on the specific equipment and manufacturer recommendations. However, a common practice is to calibrate temperature monitoring devices at least annually or more frequently based on the risk assessment. Regular preventative maintenance also extends equipment lifespan and maintains accuracy.

Q3: What actions should be taken if a temperature excursion occurs?

A3: A documented procedure is critical. Immediate steps include isolating the affected products, initiating a thorough investigation to determine the root cause (equipment malfunction, human error, etc.), and documenting all findings. Decision-making regarding product disposition (rework, destruction, etc.) should follow established guidelines.

Q4: How does the ISPE guide address the challenges of global cold chain logistics?

A4: The guide emphasizes a risk-based approach, urging consideration of geographical factors and varying environmental conditions. It recommends selecting appropriate packaging, transportation modes, and qualified logistics providers based on specific risks associated with each leg of the journey.
