FAQ

Q1: What are the major differences between open channel flow and pipe flow?

A1: Open channel flow occurs in channels open to the atmosphere, where the pressure is essentially atmospheric pressure. Pipe flow occurs in enclosed conduits, where pressure can vary significantly along the pipe length. Open channel flow is typically characterized by a free surface, while pipe flow has a fully enclosed flow. Different governing equations (e.g., Manning's equation for open channels vs. Darcy-Weisbach for pipes) are used for analysis.

Q2: How is computational fluid dynamics (CFD) used in hydraulic engineering?
