Understanding Ecosystems and Biomes: The Foundation

Ecosystems and biomes represent fundamental concepts in ecology. An **ecosystem** is a community of living organisms (plants, animals, microorganisms) interacting with each other and their non-living environment (soil, water, air). Biomes, on the other hand, are larger-scale ecological communities classified by their dominant vegetation and climate. Examples include forests (temperate deciduous forests, tropical rainforests), grasslands (savannas, prairies), deserts, and aquatic biomes (oceans, freshwater lakes). Pearson Education's science textbooks often use these definitions as a springboard to explore more complex ecological interactions.

Pearson Education science answers concerning ecosystems and biomes often explore the intricate relationships within these systems. This includes:
