- **Metabolic Regulation:** This aspect explores the mechanisms that control metabolic pathways, ensuring that

energy production and resource allocation are tightly regulated to meet cellular needs. This often involves understanding allosteric regulation and hormonal control.

IV. Enzymes: The Catalysts of Life (Chapters 21-22)

Enzymes are biological catalysts that accelerate biochemical reactions. Chapters 21 and 22 usually delve into:

- **Enzyme Kinetics:** This section describes the quantitative aspects of enzyme-catalyzed reactions, including Michaelis-Menten kinetics, enzyme inhibition, and the factors affecting enzyme activity (temperature, pH, substrate concentration). Understanding the Michaelis constant (K_m) and the maximum velocity (V_{max}) are critical here.
- **Enzyme Mechanisms:** This explores the detailed mechanisms by which enzymes catalyze reactions, often involving specific amino acid residues in the active site.
- **Enzyme Regulation:** The various mechanisms for regulating enzyme activity, including allosteric regulation, covalent modification, and feedback inhibition.

V. Nucleic Acids and Molecular Biology (Chapters 23)

Chapter 23 often introduces the structure and function of nucleic acids (DNA and RNA), building upon previous chapters' discussions of biomolecules and metabolism. This often includes:

- **DNA Replication, Transcription, and Translation:** The central dogma of molecular biology is typically explored, explaining how genetic information is replicated, transcribed into RNA, and translated into proteins. This is the foundation of genetics and molecular biology.
- **Genetic Code:** The translation of mRNA into amino acid sequences to form proteins.
